Umbraco Content Editors...

How do we help Content Editors be more comfortable, empowered, and productive using AI?

tinyMCE demo

Case Study:

How we helped the team at Mold Inspection Sciences grow traffic 80% and have a record year without buying ads.

Goal: More traffic and better leads

Challenges:

- ↳ **Traditional search was shifting to AI Assistants and answer engines**
- ↳ **Video content under utilized**
- ↳ **Years of content had accumulated and drifted off-brand**
- ↳ **Content publishing took too long**

Rationale: Make this the primary decision hub for people comparing mold sampling and testing approaches. Add clear method comparisons, preparation guidance, to professional services.

Objective: Turn this page into a clear pre-engagement decision resource that helps property owners and professionals understand which sampling approach fits their needs and drives qualified inquiries for Mold Sciences inspection, testing, and advanced qPCR services. Reduce confusion caused by duplicated copy while reinforcing the core specific science-led methodology.

Foundation: Content Restructure for Schema

How a Science-Based Mold Inspection Works

A professional mold inspection is more than a quick visual check. Every property presents a different combination of conditions, so inspectors the evidence to understand what is happening and determine the right next step. In this video, Mold Inspection Sciences explains its science to evaluating homes.

The inspection begins with careful visual observation and may include a hygrometer to assess indoor humidity, a moisture meter to detect wet walls or cabinets, and an infrared camera to identify temperature changes. When the evidence points to an area of concern, a strict sampling determine where testing is appropriate and which data will be most useful.

Mold Inspection Sciences has refined this process through approximately 80,000 inspections over about 20 years. Its inspectors generate millions of photographs and collect approximately 100,000 samples each year. That depth of field experience supports a consistent goal: gather information, identify conditions within the property, and give homeowners a clear path toward a safer, cleaner home.

"Do you have to cut into my wall to tell whether there's mold inside?" It's one of the questions our inspectors hear most often. Homeowners want reliable answers without being left with holes to repair.

Usually, the answer is no. Most mold and moisture investigations are non-invasive. Our inspectors do not cut open walls or ceilings, remove kitchen or bathroom fixtures, or lift flooring. Sometimes, however, the evidence supports a closer look inside a wall.

Mold Inspection Sciences has assessed thousands of properties where hidden moisture or mold was a concern. Here is how inspectors investigate wall cavities, what each method can tell us, and when opening a wall may be necessary.

Do You Have to Open Up a Wall to Know If Mold Is There?

WATCH NOW: See how inspectors use cavity samples and moisture meters to investigate hidden mold while keeping damage to a minimum. When a cavity sample is appropriate, the access hole is about one-quarter inch wide.

Watch Do You Have to Open Up a Wall to Know If Mold Is There?

What an Inspection Establishes Before Any Wall Is Opened

Finished wall cavities are hidden, but they are not beyond investigation. Inspectors can learn a great deal from moisture, temperature patterns, air samples, and the building's history before recommending invasive work.

Moisture Detection

Mold needs moisture to grow, so moisture readings are a practical starting point. Inspectors compare readings across a wall to establish a baseline for that material and identify areas that are unusually damp. Elevated moisture does not prove mold growth, but a consistently dry wall is less likely to support it.

Infrared Thermography

Infrared cameras show temperature differences across a surface. Those patterns can point to moisture behind the finish because evaporation cools materials. The camera does not see mold or water directly, and moisture that is not evaporating may not appear. Combined with moisture meter readings and an inspector's experience, thermal imaging helps narrow the search. By itself, it can lead to false conclusions.

Ambient Air Sampling With an Outdoor Control

Air sampling often helps investigate hidden mold without opening a wall.

A calibrated pump draws a measured volume of air through a spore trap. A certified laboratory then identifies and counts the captured mold spores and other particles. Each indoor sample is compared with an outdoor control collected at the same property and time. The outdoor sample shows what spores are naturally present and provides the baseline.

Inspection Services

Mold Inspection Services

Our mold inspection and mold testing services leverage our extensive knowledge of mold and mildew (black mold, black toxic mold, Stachybotrys, and other molds) and the conditions conducive to mold growth as well as building construction, air flows, building materials, and heating ventilation and air-conditioning systems.

Moisture Detection

Where we find mold, we find moisture. By locating the source of moisture and identifying hidden water intrusion sources we can focus our mold investigation in the right areas. Where there is water damage from a flood, leak, or natural event we can inspect and assess the water damage along with identifying the presence of mold and make recommendations on the best ways to return the home or office to a healthy state.

Infrared Technology

We use FLIR infrared camera technology to enhance our inspection services. This advanced, non-invasive technology allows our inspectors to zero in and identify potential sources of moisture to more accurately determine testing and sampling investigations. This, in turn, will allow us to make conclusions and recommendations for action during the inspection.

Certified Mold Inspectors

We value certification, education, and experience. Performing quality mold inspections requires all three. Each of our inspectors, consultants, and project managers is a Certified Mold Inspector (ACAC and/or MICRO). To protect your liability, property, and health, it's important to engage the services of a professional and certified mold inspector.

Find the Source

We track down the moisture conditions that allow mold to grow, including leaks, hidden water intrusion, and areas affected by past or ongoing water damage.

Inspect with Precision

Using infrared imaging and advanced inspection tools, we can investigate more accurately and focus attention where problems are most likely to exist.

Get Expert, Interpretable Answers

Our certified inspectors bring building science knowledge and mold-specific expertise to every inspection, helping you understand what was found and what it means.

Get Expert, Interpretable Answers

Our certified inspectors bring building science knowledge and mold-specific expertise to every inspection, helping you understand what was found and what it means.

Count On Unbiased Recommendations

Because we do not perform remediation or repairs, our conclusions are independent. You get objective guidance based on evidence, not a sales agenda.

No Conflict of Interest

We don't perform mold remediation, repair, or construction. We have no interest in the outcome of our inspections other than to ensure you have the information needed to return your home or office to a healthy state.

Clear Next Steps

After the inspection, we help you understand what was found, what it means, and what should happen next. Our reporting is designed to give property owners, tenants, and managers clear recommendations they can use to make informed decisions.

Page Evaluation

Last evaluated: Jul 3, 2026, 3:55 PM

Overall Score **4.0 / 5**

Score Breakdown

4 / 5 Value Proposition Clarity

Clear and understandable, though still somewhat product-centric rather than outcome-specific.

2 / 5 Specificity And Proof

Credibility exists, but there are no concrete customer examples or metrics.

3 / 5 Objection Handling

Basic FAQs help, but major concerns like implementation effort and DIY alternatives are not directly addressed.

4 / 5 CTA Clarity And Friction

The next step is clear and low-friction, though it could be more conversion-focused.

4 / 5 Message Hierarchy

Good structure and flow; the main value is surfaced early.

7 checks ✓ 4 passed ⚠ 3 warnings

Suggestions

Overall this is a solid REVISE-to-ACCEPT page. The biggest improvements are adding concrete proof and explicitly addressing setup/migration objections. Consider adding one short proof block with a named customer or quantified result, and one short reassurance line near the CTA such as 'Install in minutes, no custom integration required.' Also tighten the CTA to be more action-oriented, for example 'Read docs on GitHub' or 'Install via NuGet' depending on the primary conversion goal.

Items Needing Attention (3)

⚠ Specificity and proof

The copy mentions that teams use it and that it is maintained by Umbraco HQ, but it lacks concrete customer names, usage metrics, or quantified outcomes.

⚠ Objection handling

The FAQ addresses provider account requirements and supported versions, but it does not explicitly handle major objections like setup complexity, migration effort, or why this is better than building a custom integration.

**Build simple tools for specific jobs
to help Content Editors use AI
without having to prompt it**

How did it go?

- ★ Publishing new pages < 10 minutes
- ★ Traffic up 80% (50% increase in engaged traffic)
- ★ Monthly video views grew from <1K to >1 million
- ★ 2026 is a record year for leads, jobs, and revenue

Thoughts for how to approach Content Editors

- 1. Understand**
- 2. Start simple**
- 3. Create reusable tools**
- 4. Allow for experimentation**
- 5. Feedback loop**

Happy Content Editors!
